

1. Open your own laptop or desktop (or use an online PC hardware simulator if you don't have access to a real system) and identify the GPU model installed. Write down the GPU's brand, model number, and whether it is integrated or dedicated.

Specification	Details
GPU Brand	Intel
GPU Model Number	Intel® HD Graphics 520
Manufacturer	Intel Corporation
GPU Type	Integrated Graphics (iGPU)
Display Memory (VRAM)	128 MB Dedicated VRAM
Shared Memory	4025 MB
DirectX Support	DirectX 12

2. Take a clear photo or screenshot of the cooling system (fan, heatsink, or liquid cooling setup) inside your PC or from a PC hardware simulator. Label the main cooling components and briefly describe their function.

3.Create a comparison table listing at least 3 differences between air cooling and liquid cooling systems for GPUs, including factors like cost, efficiency, and maintenance.

Factor	Air Cooling (GPU)	Liquid Cooling (GPU)
Cooling Method	Uses fans and heatsinks to dissipate heat	Uses coolant, water blocks, pump, and radiator to remove heat
Cooling Efficiency	Good for normal gaming and everyday use	Better for high-performance gaming and overclocking
Cost	Lower cost and more affordable	More expensive due to additional components
Maintenance	Requires minimal maintenance (mainly dust cleaning)	Requires periodic maintenance and checking for leaks
Noise Level	Can be noisier at high fan speeds	Generally quieter because fans run at lower speeds
Installation	Simple and easy to install	More complex installation process
Size Requirements	Fits in most PC cases	Requires extra space for radiator and tubing
Reliability	Fewer components, lower risk of failure	More components, slight risk of pump failure or leakage
Typical Use Cases	Standard desktops, office PCs, mainstream gaming	High-end gaming PCs, workstations, and overclocked systems

4. Imagine you are building a gaming PC for streaming IPL matches and playing graphics-heavy games. Choose between air cooling and liquid cooling for your GPU, and justify your choice in 3-4 sentences based on your research.

- I would choose liquid cooling for my GPU. Liquid cooling provides better heat dissipation and keeps the GPU temperature lower during long gaming sessions and while streaming IPL matches. It also operates more quietly than air cooling, which is useful when recording or live streaming. Although liquid cooling is more expensive and requires more maintenance, its superior cooling performance makes it ideal for high-end, graphics-intensive gaming PCs.
